EXPERIENCE

Backend Engineering Intern

Jan 2026 – Present

JAR — Digital Gold & Silver Investment Platform

- Owned the Silver investment vertical end-to-end — from PRD review and system design through implementation, QA, and production rollout — shipping production features that reach millions of users.
- Led Silver autopay expansion initiative enabling daily savings for Gold inactive users; architected dual-flow routing (quick-setup vs. payment) based on user cohort and transaction thresholds, designed pill selection algorithm with fallback mechanisms, and implemented conditional UPI app pre-selection logic — expanding addressable Silver autopay user base while maintaining payment flow consistency across Gold/Silver products.
- Designed and shipped Silver Aggregation API that replaced multiple fragmented inter-service HTTP calls with a single `/silver/process` endpoint, eliminating redundant round trips and improving reliability across distributed microservices.
- Built the Silver cohort eligibility engine enforcing complex multi-condition business logic — GMV thresholds, transaction slabs, KYC status, and daily savings mandates — driving Silver entry point adoption to ~45% of the eligible user base; instrumented analytics event properties (Fetched BottomTabs, BottomNavbar Clicked, SILVER DAILY SAVINGS SETUP) and managed user-facing content via config server enabling dynamic copy updates without app releases.
- Led feature experimentation using Unleash — designed and executed controlled rollouts with independent control/test splits across 3 iterative requirement cycles, enabling safe production deployments with instant kill-switch capability and zero downtime releases.
- Cut mean time to resolution by 30% by instrumenting Grafana dashboards and Kibana proactive alerting across test, staging, and production; raised team test coverage from 72% to 91% through systematic JUnit unit and integration test suites, eliminating post-deployment bugs and improving release confidence.
- Took on-call ownership for live, user-facing microservices under active A/B testing; monitored system health, detected service degradation, and drove incident resolution through structured response and blameless root cause analysis.

PROJECTS

Kirana Register | *Java, PostgreSQL, Redis, Kafka, Git, GitHub Actions*

- Delivered end-to-end microservices platform handling 50K+ monthly transactions; owned architecture, implementation, observability, and production operations across the full service lifecycle.
- Implemented Kafka event pipelines for order processing and inventory updates with idempotent message handling; designed PostgreSQL schemas and Redis caching layer significantly reducing inventory lookup latency for real-time merchant operations.
- Built Prometheus/Grafana dashboards with anomaly-based alerting enabling proactive incident detection; automated CI/CD quality gates via GitHub Actions achieving 91% test coverage across unit and integration suites.
- Deployed feature rollouts using phased release strategies — progressive traffic routing, environment-based gating, and automated rollback triggers — ensuring safe, high-confidence production deployments with zero customer impact.

Distributed Real-Time Processing Engine | *Java, Python, Kafka, PySpark, MySQL, MongoDB, PostgreSQL*

- Built Kafka + PySpark streaming platform for high-throughput supply chain and payment event processing; reduced data latency by 35% through algorithm optimization.
- Designed fault-tolerant architecture with exactly-once semantics and automated recovery; tracking lag, throughput, and error rates across distributed processing nodes.
- Implemented dual-database strategy using PostgreSQL for transactional data and MongoDB for flexible analytics; balanced consistency and performance based on query patterns.

TECHNICAL SKILLS

Languages: Java, C++, SQL, Python

Backend & Architecture: Java/Spring Boot, Microservices, RESTful APIs, Inter-Service Orchestration, Kafka, Distributed Transactions

Experimentation & Feature Delivery: Unleash Feature Flags, A/B Testing, Controlled Rollouts, Kill-Switch Gating, Phased Releases, Zero-Downtime Deployments

Databases: PostgreSQL, MySQL, Schema Design, MongoDB, Redis, Caching, Document Storage

Observability & Reliability: Prometheus, Grafana, Distributed Tracing, Kibana, Incident Response

Testing & Quality: JUnit, Integration Testing, TDD, Code Reviews, Automated Quality Gates

Delivery & Collaboration: End-to-End Feature Ownership, Scrum, PRD Collaboration, Cross-Functional Teamwork, Technical Documentation

EDUCATION

PES University
B.Tech in Computer Science and Engineering

Siddaganga PU College
Higher Secondary Education

Graduating May 2026
CGPA: 8.2 / 10.0

May 2022
94%
